NOTICE: To facilitate installation, this accessory is equipped with new **E-Z NUT™** insert & twist trak nuts. Accessory may be installed from the face of the support rail without sliding in from the end of the rail. Thus, it is no longer necessary to remove the top components from an existing workstation in order to install an accessory to be located lower on the upright. Older style rectangular trak nuts are also included with this accessory and should be used for installation on Unistrut or other trak with an opening greater than 0.55" (14mm) in width.

**INSTALLATION**

1. Determine approximate location for accessory on support rail.

2. With **E-Z NUT™** on hex head bolt, insert nut into trak opening (Fig.1) and turn bolt head with fingers to be sure **E-Z NUT™** rotates inside rail to achieve maximum engagement.

3. Slide accessory into desired position.

4. Fully tighten bolts, again being sure **E-Z NUT™** is rotated inside rail. Torque bolts to recommended 6 ft/lbs (10 ft/lbs maximum).
